## European Technical Assessment ETA-07/0285 of 03/12/2015

### I General Part

**Technical Assessment Body issuing the ETA and designated according to Article 29 of the Regulation (EU) No 305/2011:** ETA-Danmark A/S

**Trade name of the construction product:**

Hold Downs  
Post Bases

**Product family to which the above construction product belongs:**

Three-dimensional nailing plate (timber to timber and timber to concrete/steel hold downs and post bases)

**Manufacturer:**

SIMPSON STRONG-TIE A/S  
Hedegaardsvej 4 – 11, Boulstrup  
DK-8300 Odder  
Tel. +45 87 81 74 00  
Fax +45 87 81 74 09

**Manufacturing plant:**

Simpson Strong-Tie A/S Hedegaards vej 4-11, Boulstrup 8300 Odder Denmark	Simpson Strong-Tie 5151 S. Airport Way Stockton CA 95206 USA	Simpson Strong-Tie 2600 Internatio- nal Street Columbus, OH 43228 USA	Simpson Strong-Tie ZAC des Quatre Chemins 85400 Sainte Gemme La Plaine France	Simpson Strong-Tie Winchester Road Cardinal Point Tamworth Staffordshire B78 3HG United Kingdom
--	---	--	--	---

**This European Technical Assessment contains:**

128 pages including 4 annexes which form an integral part of the document

**This European Technical Assessment is issued in accordance with Regulation (EU) No 305/2011, on the basis of:**

Guideline for European Technical Approval (ETAG) No. 015 Three Dimensional Nailing Plates, April 2013, used as European Assessment Document (EAD).

**This version replaces:**

The ETA with the same number and issued on 2013-04-30 and expiry on 2018-04-30

## INDEX

Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and should be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full (excepted the confidential Annex(es) referred to above). However, partial reproduction may be made, with the written consent of the issuing Technical Assessment Body. Any partial reproduction has to be identified as such.

## II SPECIFIC PART OF THE EUROPEAN TECHNICAL ASSESSMENT

### 1 Technical description of product and intended use

#### Technical description of the product

The hold downs are one or more pieces, non-welded hold downs. They are intended for timber to timber, timber to concrete or timber to steel connections fastened by a range of nails, screws or bolts.

Post base ABE, PBS and U-shoe are manufactured by pressing of galvanized steel plates. PBP60/50 is manufactured by pressing of raw steel. All other post bases are welded steel connectors.

The upper part e.g. a plate, a U-shaped plate or a vertical plate for embedment into the timber is fastened to the timber member with nails, screws, bolts or dowels.

The lower part of the post base is either a bar, a threaded rod, a tube or a plate for embedment into the support of concrete or a steel plate to be fastened by anchor bolts to the concrete support.

Steel quality, dimensions of the post bases, hole positions and corrosion protection are shown in Annex D.

The post bases and hold downs can also be produced from stainless steel type 1.4401 or type 1.4404 according to EN 10088-2 or a stainless steel with a minimum characteristic yield stress of 235 N/mm<sup>2</sup> or a minimum ultimate tensile strength of 330 N/mm<sup>2</sup>. Dimensions, hole positions, steel type and typical installations are shown in Annex B and D.

### 2 Specification of the intended use in accordance with the applicable EAD

The intended use of the post bases and the hold downs is to support timber structures or wood-based structural members to their support, where requirements for mechanical resistance and stability and safety in use in the sense of the Basic Works Requirements 1 and 4 of Regulation (EU) 305/2011 shall be fulfilled. Each connection shall be made with one post base.

The static and kinematic behaviour of the timber members or the supports shall be as described in Annex D.

The wood members can be of solid timber, glued laminated timber and similar glued members, or wood-based structural members with a characteristic density

from 290 kg/m<sup>3</sup> to 420 kg/m<sup>3</sup>.

This requirement to the material of the wood members can be fulfilled by using the following materials:

- Solid timber classified to C14-C40 according to EN 338 / EN 14081
- Glued members of timber classified to C14-C40 according to EN 338 / EN 14081 when structural adhesives are used.
- Glued laminated timber classified to GL24c or better according to EN 1194 / EN 14080.
- Solid Wood Panels, SWP according to EN 13353.
- Laminated Veneer Lumber LVL according to EN 14374
- Plywood according to EN 636
- Oriented Strand Board, OSB according to EN 300

Annex C states formulas for the characteristic load-carrying capacity of the post bases and the hold down connections, which depend on the characteristic density of the timber employed.

For some of the connectors Annex D states the load-carrying capacities of the post bases and the hold down connections for a characteristic density of 350 kg/m<sup>3</sup>.

For timber or wood based material with a lower characteristic density than 350 kg/m<sup>3</sup> the load-carrying capacities shall be reduced by the k<sub>dens</sub> factor:

$$k_{dens} = \left( \frac{\rho_k}{350} \right)$$

Where ρ<sub>k</sub> is the characteristic density of the timber in kg/m<sup>3</sup>.

For timber or wood based material with a higher characteristic density than 350 kg/m<sup>3</sup> the load-carrying capacities shall be taken as that for 350 kg/m<sup>3</sup> unless detailed analyses are conducted.

The design of the connections shall be in accordance with Eurocode 5 or a similar national Timber Code. The wood members shall have a thickness which is larger than the penetration depth of the nails into the members.

The hold downs are primarily for use in timber structures subject to the dry, internal conditions defined by service class 1 and 2 of Eurocode 5 and for connections subject to static or quasi-static loading.

The hold downs can also be used in outdoor timber structures, service class 3, when a corrosion protection in accordance with Eurocode 5 is applied, or when stainless steel with similar or better characteristic yield or ultimate strength is employed.

The post bases with a zinc coating Z275 according to EN 10346 or G90 according to ASTM A-653 are intended for use in service class 1 and 2 according to EN 1995 (Eurocode 5).

Post bases which are hot dipped galvanized according to EN ISO 1461:1999 with a zinc coating thickness of approximately 55 µm or made from stainless steel according to EN 10088:2005 or sherardized according to EN 13811:2003 or electroplated zinc according to EN 1403 and 12329:2000 allowing a use in external conditions are intended for use in service class 1,2 and 3 according to EN 1995 (Eurocode 5).

The hold downs may also be used for connections between a timber member and a support made from concrete blocks or similar.

The provisions made in this European Technical Assessment are based on an assumed intended working life of the connectors of 50 years.

The indications given on the working life cannot be interpreted as a guarantee given by the producer or Assessment Body, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

### 3 Performance of the product and references to the methods used for its assessment

Characteristic	Assessment of characteristic
<b>3.1 Mechanical resistance and stability*) (BWR1)</b>	
Characteristic load-carrying capacity	See Annex D
Stiffness	No performance assessed
Ductility in cyclic testing	No performance assessed
<b>3.2 Safety in case of fire (BWR2)</b>	
Reaction to fire	The post bases are made from steel classified as Euroclass A1 in accordance with EN 13501-1 and EC decision 96/603/EC, amended by EC Decision 2000/605/EC
<b>3.3 Hygiene, health and the environment (BWR3)</b>	
Influence on air quality	The product does not contain/release dangerous substances specified in TR 034, dated March 2012**)
<b>3.7 Sustainable use of natural resources (BWR7)</b>	No Performance Determined
<b>3.8 General aspects related to the performance of the product</b>	The post bases have been assessed as having satisfactory durability and serviceability when used in timber structures using the timber species described in Eurocode 5 and subject to the conditions defined by service class 1, 2 and 3
Identification	See Annex A

\*) See additional information in section 3.9 – 3.12.

\*\*) In addition to the specific clauses relating to dangerous substances contained in this European technical Assessment, there may be other requirements applicable to the products falling within its scope (e.g. transposed European legislation and national laws, regulations and administrative provisions). In order to meet the provisions of the Construction Products Regulation, these requirements need also to be complied with, when and where they apply.

### 3.9 Safety principles and partial factors

The characteristic load-carrying capacities have been calculated considering different ratios between the partial factors for timber connections and steel cross sections.

According to clause 6.3.5 of EN 1990 (Eurocode – Basis of structural design) the characteristic resistance for structural members that comprise more than one material acting in association should be calculated as

$$R_d = \frac{1}{\gamma_{M,1}} R \left\{ \eta_1 X_{k,1}; \eta_i X_{k,i(i>1)} \frac{\gamma_{m,1}}{\gamma_{m,i}}; a_d \right\}$$

where  $\gamma_{M,1}$  is the global partial factor for material 1 (in this case wood),  $\gamma_{m,1}$  is the partial factor on the material and  $\gamma_{m,i}$  are material partial factors for the other materials, i.e. the calculations are made with material parameters modified by multiplication by

$$k_{modi} = \gamma_{m,1} / \gamma_{m,i}$$

The characteristic load-carrying capacities have been calculated considering a ratio between the partial factor for timber connections and steel / concrete cross sections

$k_{modi} = 1,18$  for steel yield strength

$$(EC5: k_{modi,y} = \frac{1,30}{1,10} = 1,18)$$

$k_{modi} = 1,0$  for steel ultimate strength

$$(EC5: k_{modi,u} = \frac{1,30}{1,25} \approx 1,0)$$

$k_{modi} = 0,87$  for anchor bolt in concrete

$$(EC5: k_{modi,c} = \frac{1,30}{1,50} = 0,87)$$

For  $k_{modi} > 1,18 / 1,0 / 0,87$  the load-carrying capacities stated in Annex B and D are valid (on the safe side).

For  $k_{modi} < 1,18 / 1,0 / 0,87$  the load-carrying capacities stated in Annex B have to be multiplied by a factor

$$k_{safe} = \frac{k_{modi,y}}{1,18} \text{ or } \frac{k_{modi,u}}{1,0} \text{ or } \frac{k_{modi,c}}{0,87}$$

### 3.10 Mechanical resistance and stability

See annex D for characteristic load-carrying capacity in the different force directions F<sub>1</sub> to F<sub>5</sub>.

The characteristic capacities of the post bases and the hold downs are determined by calculation assisted by testing as described in the EOTA Guideline 015 clause 5.1.2. They should be used for designs in accordance with Eurocode 5 or a similar national Timber Code.

No performance has been determined in relation to ductility of a joint under cyclic testing. The contribution to the performance of structures in seismic zones, therefore, has not been assessed.

No performance has been determined in relation to the joint's stiffness properties - to be used for the analysis of the serviceability limit state.

#### Fastener

*Connector nails and screws in accordance with ETA-04/0013*

The load-carrying capacities of the post bases and the hold downs have been determined based on the use of connector nails 4,0x35, 4,0x40, 4,0x50 or 4,0x60 in accordance with ETA-04/0013. It is allowed to use connector screws 5,0x35, 5,0x40 or 5,0x50 or connector nails 4,2x35, 4,2x50 or 4,2x60 in accordance with ETA-04/0013 with the same or better performance as the 4,0 mm connector nails and still achieve the same load-carrying capacity of the connection.

The capacity of a post base connection and a hold down connection with 4,0x50 connector nails in accordance with ETA-04/0013 can be calculated by linear interpolation between the capacities for 4,0x40 and 4,0x60 connector nails.

#### *Threaded nails in accordance with EN 14592*

The design model also allows the use of threaded nails in accordance with EN 14592 with a diameter in the range 4,0 – 4,2 mm and a minimum length of 35 mm, assuming a thick steel plat when calculating the lateral nail load-carrying capacity. If no calculations are made a reduction factor equal to the ratio between the characteristic withdrawal capacity of the actual used threaded nail and the characteristic withdrawal capacity of the corresponding connector nail according to table B1 in ETA-04/0013 is applicable for all load-carrying capacities of the connection.

#### *Other fasteners*

Further, for most hold downs, anchor bolts are assumed as fasteners to a reinforced concrete structure. For such hold downs it is stated at the tables with load-carrying capacities (Annex B) which characteristic capacities have been assumed for the bolt connection. Bolts to a steel structure with at least the same capacities can also be used.

## **Stainless steel**

For the post bases and the hold downs produced from stainless steel type 1.4401 or type 1.4404 according to EN 10088-4:2005 or a stainless steel with a minimum characteristic 0.2% yield stress of 240 N/mm<sup>2</sup>, a minimum 1.0% yield stress of 270 N/mm<sup>2</sup> and a minimum ultimate tensile strength of 530 N/mm<sup>2</sup> the characteristic load carrying capacities can be considered as the same as those published in this document subject to the use of stainless CNA connector nails or CSA connector screws covered by the ETA-04/0013 or stainless threaded nails or screws in accordance to the standard EN 14592 respecting the rules given in the paragraph "fasteners" above.

## **3.11 Aspects related to the performance of the product**

### **3.11.1 Corrosion protection in service class 1 and 2**

In accordance with ETAG 015 the hold downs shall have a zinc coating weight of min. Z275. The steel employed is S250 GD with min. Z275 according to EN 10346 and G90 SS Grade 33 according to ASTM A-653.

### **3.11.2 Corrosion protection in service class 3**

In accordance with Eurocode 5 the hold downs with a thickness of up to 3 mm shall be made from stainless steel. Hold downs with a thickness from 3 to 5 mm can be made from stainless steel or have a zinc coating of min. Fe/Zn 25c/Z350 according to ISO 2081/EN 10147. The nails or screws shall be produced from stainless steel or have a zinc coating of min. Fe/Zn 25c.

This requirement is fulfilled by post bases with a corrosion protection hot-dip galvanized of approximately 55 µm according to EN ISO 1461:1999 or stainless steel according to EN10088:2005 or electroplated zinc coating according to EN12329:2000 allowing a use of the product in external conditions or sherardizing according to EN 13811:2003.

## **3.12 General aspects related to the fitness for use of the product**

The post bases and the hold downs are manufactured in accordance with the provisions of the European Technical Assessment using the automated manufacturing process as identified during the inspection of the plant by notified inspection body and laid down in the technical documentation.

The execution of the connection shall be in accordance with the manufacturers installation guide.

### **Hold downs**

A hold down connection is deemed fit for use provided:

- The forces shall act on the timber members as described in Annex C.
- The timber member shall be free from wane under the nails in the vertical flap.
- The support shall be restrained against rotation.
- Nail or screw types and sizes shall be those mentioned in the tables of Annex D.
- The nails or screws shall be inserted without pre-drilling of the holes.
- There shall be nails or screws in the holes as prescribed in Annex D.
- There shall be no gap between the hold down connector and the timber member or the support, unless otherwise described
- The bolts shall have a diameter not less than the hole diameter minus 2 mm.
- The bolts shall have washers as specified in Annex C

### **Post bases**

The stated type of fasteners for each post base has to be applied in applicable holes in the post base.

The installation instructions provided by the manufacturer stipulate:

- The primary structural member – the post member shown in typical installation page 16 or a beam member - to which the post bases are fixed shall be:
  - Restrained against rotation
  - Capable to transfer the force to the post bases as assumed.
  - Free from wane in areas in contact with the post base.
- The secondary structural member – the concrete support - to which the post bases are fixed shall be:
  - Made from concrete of at least strength class C15, unless otherwise is indicated in annex C of this ETA.
- To ensure sufficient capacity the designer has to take into account splitting of the timber.
- The timber member shall be free from wane.
- There shall be no gap between the timber and the horizontal contact area.
- Otherwise the gap between the timber member and the post base may not exceed 3 mm.
- There are no specific requirements relating to preparation of the timber members.

## **4 Attestation and verification of constancy of performance (AVCP)**

### **4.1 AVCP system**

According to the decision 97/638/EC of the European Commission<sup>1</sup>, as amended, the system(s) of assessment and verification of constancy of performance (see Annex V to Regulation (EU) No 305/2011) is 2+.

## **5 Technical details necessary for the implementation of the AVCP system, as foreseen in the applicable EAD**

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited at ETA-Danmark

Issued in Copenhagen on 2015-12-03 by

Thomas Bruun  
Managing Director, ETA-Danmark

## Annex A: Revision History

<b><i>Modifications and additions to the previous ETA-07/0285 valid from 2013-04-30 to 2018-04-30</i></b>	
Pages	Update
1-5	Renamed the index
D33	Added PU /EMBU
D6	Load values
D34	Added CPT
D35	Added ABW
D36	Added APR110/150
D37	Added PBH75 / PBH120
D63	AKR: added new size 205; added new nail pattern
D64-4	AH16050: added new load application table
D1	PPD: Add no. + size of nails, add min. concrete type, add load table for "C20"
D18	APB100/150: adjust name table
Tab. D19-2	PPRC: update Zinc coating
Fig. D61-1	HD3B: include sizes into the drawing
Tab. D68-3	HE-anchor: adjust formula

## Table with the product names and alternative names / Hold downs

Alternative names are given by the products in annex D

The annexed "x" in the name of products is for the different size of products, the range is given in the Annex A.

It may be possible to add at the end of name following letter and/or combinations.

- G = galvanized
- S or S2 or IX = Stainless or Inox
- HCR = high corrosion resistant steel
- K = Kit; incl. fasteners
- B = without Barcode
- R = retail

## Annex B Typical Installation

### B1 Typical installation post bases

## B2 Typical installation hold down

## Annex C Characteristic load-carrying capacity

### C1 Design Basis - general

The design values  $F_d$  are calculated from the modified characteristic capacities  $F_{R,k}$  for service class 1 and 2 and the indicated load-duration classes as:

$$F_d = \frac{F_{R,k}}{\gamma_M}$$

with the material partial coefficient  $\gamma_M$  for wood.

Modified characteristic capacity means, that the characteristic load-carrying capacities have been modified by the factor  $k_{mod}$  as given in **Table 1**.

The design values  $F_d$  are calculated from characteristic capacities  $F_{R,k}$  as:

$$R_d = \frac{k_{mod} R_k}{\gamma_M}$$

with the material partial coefficient  $\gamma_M$  for wood and the load-duration factor  $k_{mod}$  is given in table 1 or 2, correspondent the service class

Table 1 Factor  $k_{mod}$  for service class 1 and 2

Load duration class and $k_{mod}$ factors for service class 1 and 2				
P	L	M	S	I
Permanent	Long term	Medium term	Short term	Instantaneous
0,6	0,7	0,8	0,9	1,1

Table 2 Factor  $k_{mod}$  for service class 3

Load duration class and $k_{mod}$ factors for service class 3				
P	L	M	S	I
Permanent	Long term	Medium term	Short term	Instantaneous
0,5	0,55	0,65	0,7	0,9

For Service class 3 the characteristic capacities may be calculated from values given in tables by interpolation analog to the  $k_{mod}$  factors, or using the formulas with the relevant  $k_{mod}$ .

### Density

The load-carrying capacities of the post base and the hold downs connections are stated for a timber strength class C24 with a characteristic density of 350 kg/m<sup>3</sup> unless otherwise indicated.

The load-carrying capacity of the connections for a lower characteristic density should be determined under the assumption that the load-carrying capacity is proportional to the density. In consequence, the value should be reduced using the factor  $k_{dens}$  as defined below:

$$k_{dens} = \left( \frac{\rho_k}{350} \right)$$

where  $\rho_k$  is the characteristic density of the timber in kg/m<sup>3</sup> and 350 is the characteristic density for timber class C24 in kg/m<sup>3</sup>.

The load-carrying capacity for a larger characteristic density shall be taken as equal to the one published in this document unless a special investigation is made

## Concrete

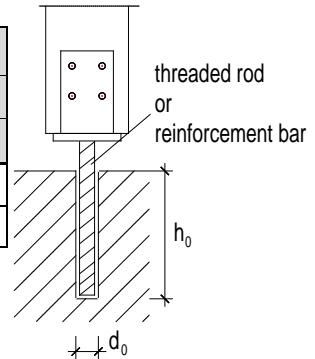

The load-carrying capacities of the post base connections are stated for a concrete class C15 unless otherwise indicated.

### Installation with bonded anchorage

The post bases of types: **PJIS, PLS, PJPS, PPS** may be installed in reinforced or unreinforced normal weight concrete of strength class C20/25 at minimum as a post-installed-anchorage with injection system Simpson Strong-Tie® SET-XP Epoxy Adhesive Injection System (acc. ETA-11/0360) or Simpson Strong-Tie® AT-HP™ (acc. ETA-11/0150 or ETA-11/0151). The design of the anchorage installation shall be performed in accordance with the latest versions of the equivalent European technical approval (ETA).

The post bases of types: **PI, PP, PPD** may be installed in reinforced or unreinforced normal weight concrete of strength class C20/25 at minimum as a post-installed-anchorage with injection system Simpson Strong-Tie® SET-XP Epoxy Adhesive Injection System. The design of the anchorage installation shall be performed in accordance with the latest version of the European technical approval ETA-11/0360.

Injection Mortar System	Drill hole diameter $d_0$			
	Threaded rod		Reinforcement bar	
	M16	M20	Ø16	Ø20
SET-XP	18 mm	24 mm	20 mm	25 mm
AT-HP	18 mm	22 mm	-/-	-/-

### Wane

Where force is carried by contact compression no wane may occur.

Where the lateral force is acting toward a Hold Down connector the force is carried by contact compression so for this case no wane may occur in the surface of the timber under the vertical flap. Additionally, no wane may occur under the nails.

### Fastening

Unless otherwise indicated in the calculations the holes in the post bases have to be fully applied with the applicable fasteners. The fastener types for which the calculations have been made are stated at each post base.

The nail pattern shall be as described in Annex D. The fastener types for which the calculations have been made are stated at the relevant post bases and hold downs.

The thickness of the beam shall be a minimum of the embedment depth of the nails or screws.

### Assumed characteristic capacities of anchor bolts

The capacity of the anchor bolts are to be checked.

The calculations to use corresponding to the forces are outlined below:

For a lateral load: the axial force for the bolt:

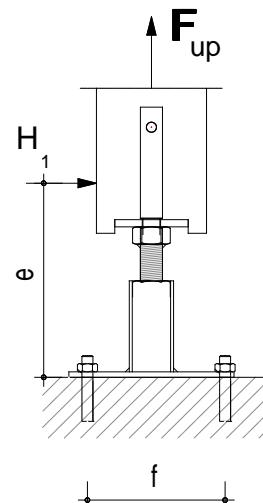

$$F_{\text{axial,bolt}} = H_1 \times e / f$$

$$F_{\text{lateral,bolt}} = H_1 / n$$

For an uplift load:

$$F_{\text{axial,bolt}} = F_{\text{up}} / n$$

With  $n$  = number of bolts.

The above method should be used to check anchor bolt capacities unless otherwise stated alongside the product details.

## C2 Definition of force directions

### C2a Force directions for post bases

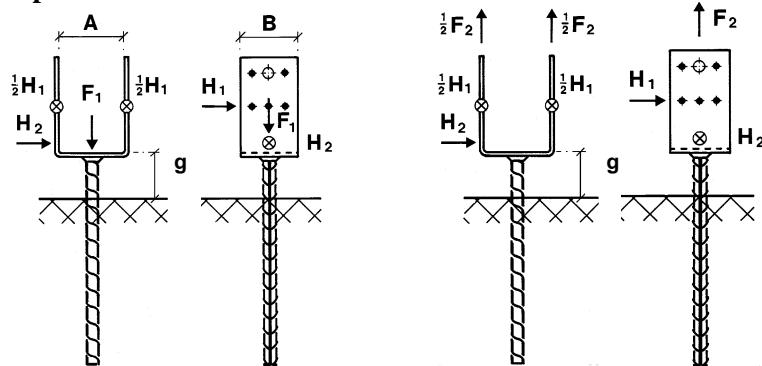

Figure C2a.Typical connection with notation for loads. The actual force directions are indicated at each post base  
The capacities in the tables are stated in kN and kNm.

#### Gap

The gap ( $g$ ) is the distance from the top side of the concrete to the top side of the top plate. The gap is stated for each post base in the following.

#### Acting forces

Unless otherwise indicated in the tables with load-carrying capacities, the forces are assumed to act as described below:

$F_1$  Load-carrying capacity for downward load acting along the central axis of the joint

$F_2$  Load-carrying capacity for upward load acting along the central axis of the joint

$H_1$  Load-carrying capacity for lateral load acting in the centre of the post in line with the lower row of holes

$H_2$  Load-carrying capacity for axial load acting in the centre of the compression zone at the bottom of the timber member

$M_{1/2}$  are described by types CMR and CMS

#### Combined forces

In the following tables the load-carrying capacities are given for the individual loads:  $F_1$ ,  $F_2$ ,  $H_1$  and  $H_2$ .

For combinations of loads it is – unless otherwise indicated – sufficient to verify that the individual loads can be taken.

For horizontal loads  $H_1$  and  $H_2$  acting simultaneously the resulting horizontal load shall be calculated as

$$H = \sqrt{H_1^2 + H_2^2}$$

## C2b Forces directions for hold downs

The characteristic load-carrying capacities are determined for the following force directions.

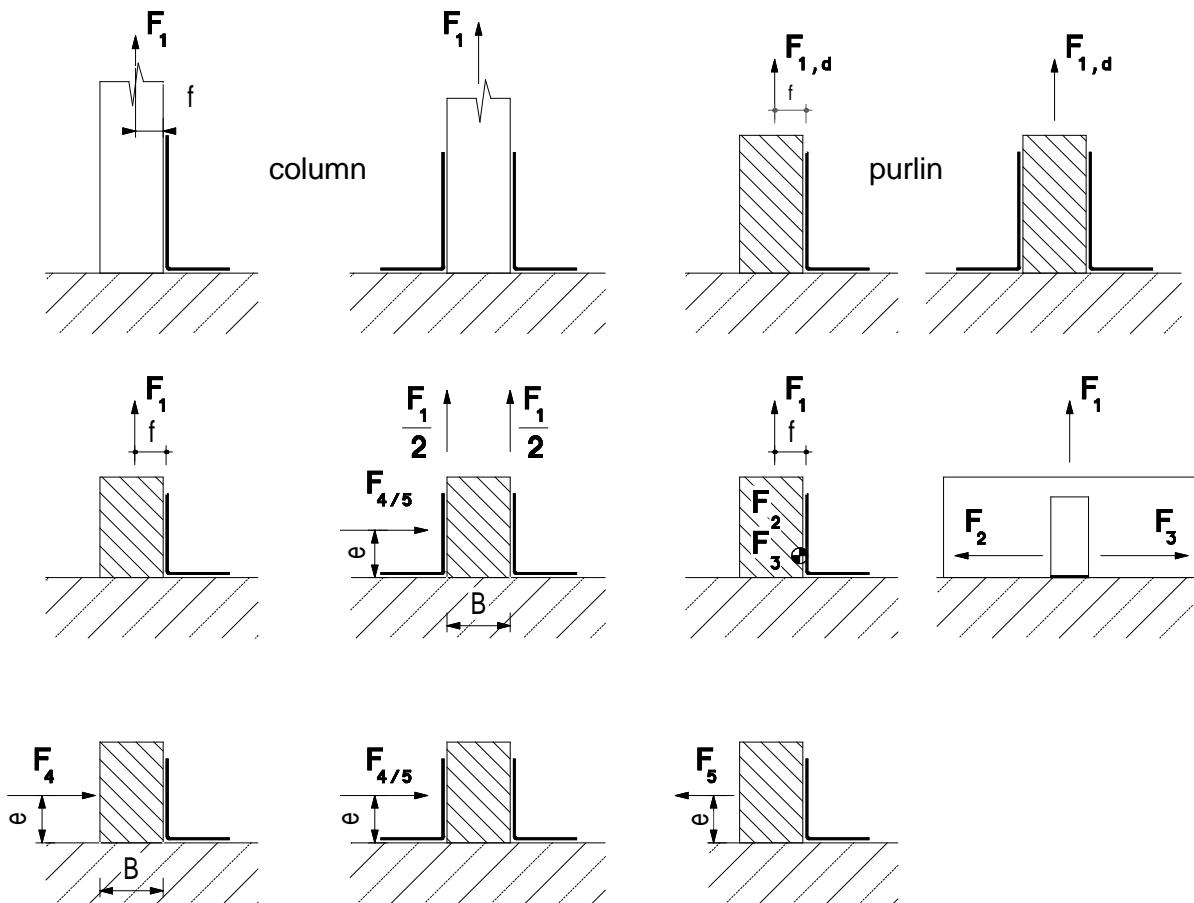

Figure C2b: Forces and their assumed positions. Top row for Hold Downs only subjected to a lifting force. Bottom rows for Hold Downs subjected to both eccentric lifting forces and lateral forces.

Two hold downs

- $F_1$  Lifting force acting along the central axis of the joint
- $F_2$  and  $F_3$  Lateral force acting in the joint between the purlin and beam in the purlin direction
- $F_4$  and  $F_5$  Lateral force acting in the beam direction along the axis of the joint but elevated  $e$  above the beam

One hold down per connection

- $F_1$  Lifting force acting in the central axis of the hold down but in a distance  $f$  from the vertical flap of the hold down  
If the purlin is prevented from rotation the load-carrying capacity will be half that of a connection with two hold downs
- $F_2$  and  $F_3$  Lateral force acting in the joint between the purlin and the beam in the purlin direction
- $F_4$  Lateral force acting in the beam direction perpendicular to the vertical flap elevated  $e$  above the beam directed towards the hold downs vertical flap
- $F_5$  Lateral force acting in the beam direction perpendicular to the vertical flap elevated  $e$  above the beam directed away from the hold downs vertical flap

### Combined forces

For practical purposes the strength verification is always carried out for design forces and design capacities. If the forces are combined the following inequalities shall be fulfilled:

$$\sum_{1-i} \left( \frac{F_{i,d}}{R_{i,d}} \right) \leq 1,0$$

For the hold down AKR shall be fulfilled:  $\left( \frac{F_{1,d}}{R_{1,d}} + \frac{F_{4/5,d}}{R_{4/5,d}} \right)^2 + \left( \frac{F_{2/3,d}}{R_{2/3,d}} \right)^2 \leq 1,0$

The capacity can be limited by the capacity of the anchor bolt. This has to be investigated separately, see below.

**Additional conditions**

The nail pattern shall be as described in Annex D. The fastener types for which the calculations have been made are stated at the relevant hold downs.

The thickness of the beam shall be according to Eurocode 5,  $t_{pen}$  shall be min.  $6d$ , where  $d$  is the diameter of the nail or screw.

### C3 Fasteners

<b>Nail, screw and bolt type</b>	<b>Nail, screw and bolt size (mm)</b>		<b>Finish and corrosion protection</b>

$F_{R1}$	PPA100 / PBL 100 PPA150 / PBL 150	55,9	61,7	67,3	72,9	83,7

The capacities for post base PPA are valid also for the case, where the connector is turned upside down.

## D11: PJPS / PJPB / PJIS / PJIB

Product Name	alternative names			
	UK	France	DK	D
PJPS				JPS
PJPB				JPB
PJIS				JIS
PJIB				JIB

**Figure D11-1: Drawings**

**Table D11-1: Size specification**

n/a

**Table D11-2: Material specification**

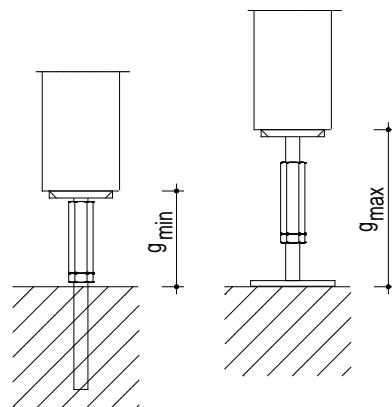

Material thickness	Material Grades	Coating specification
8, 10	S235JR according to EN 10025:2004	Hot-dip galvanized according to EN ISO 1461:1999
Threaded rod	S355 JO according to EN 10025:2004	
	Or stainless steel as described	

**Table D11-3: Characteristic capacity – for concrete C12**

$k_{mod}=1,18$

Load direction	width of timber b [mm]	<b>PJIS and PJIB</b>	
		characteristic capacity (kN) min. of timber	steel <sup>1)</sup>
F <sub>1</sub>		90,7	54,5
F <sub>2</sub>	80	16,0	
	100	18,7	
	120	20,7	
H <sub>1</sub>	bei g <sub>min</sub>		1,4
	bei g <sub>max</sub>		1,1
H <sub>2</sub> bei g <sub>min</sub>	80	2,0	1,6
	100	2,3	1,8
	120	2,6	1,8
H <sub>2</sub> bei g <sub>max</sub>	80	1,7	1,4
	100	2,0	1,4
	120	2,1	1,4

<sup>1)</sup> for steel  $k_{mod} = 1,0$  shall be used for all load durations

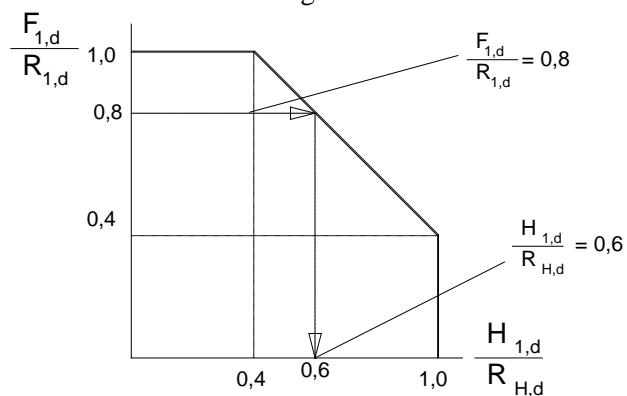

Load direction	Type	<b>PJPS und PJPB</b>	
		characteristic capacity (kN) min. of timber	steel <sup>1)</sup>
F <sub>1</sub>	PJPB		54,5
	PJPS		
F <sub>2</sub>	PJPB	7,6	
	PJPS		
H	PJPB und PJPS	2,7	1,7 1,4

<sup>1)</sup> for steel  $k_{mod} = 1,0$  shall be used for all load durations

For types PJPS and PJPB are no difference for H<sub>1</sub> and H<sub>2</sub>.

For vertical load F<sub>1</sub> and horizontal load H acting simultaneously it shall be verified that the combination of loads fall below

the lines shown in the diagram.

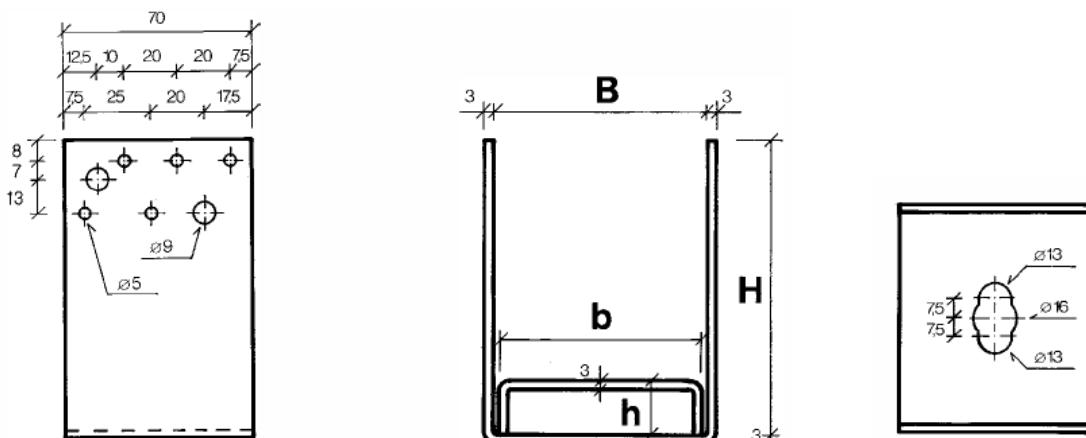

For vertical load  $F_2$  and any horizontal load  $H$  acting simultaneously it shall be verified that:  
 $F_2 / F_{R,2} + H / H_R \leq 1$

	24/280		1,9

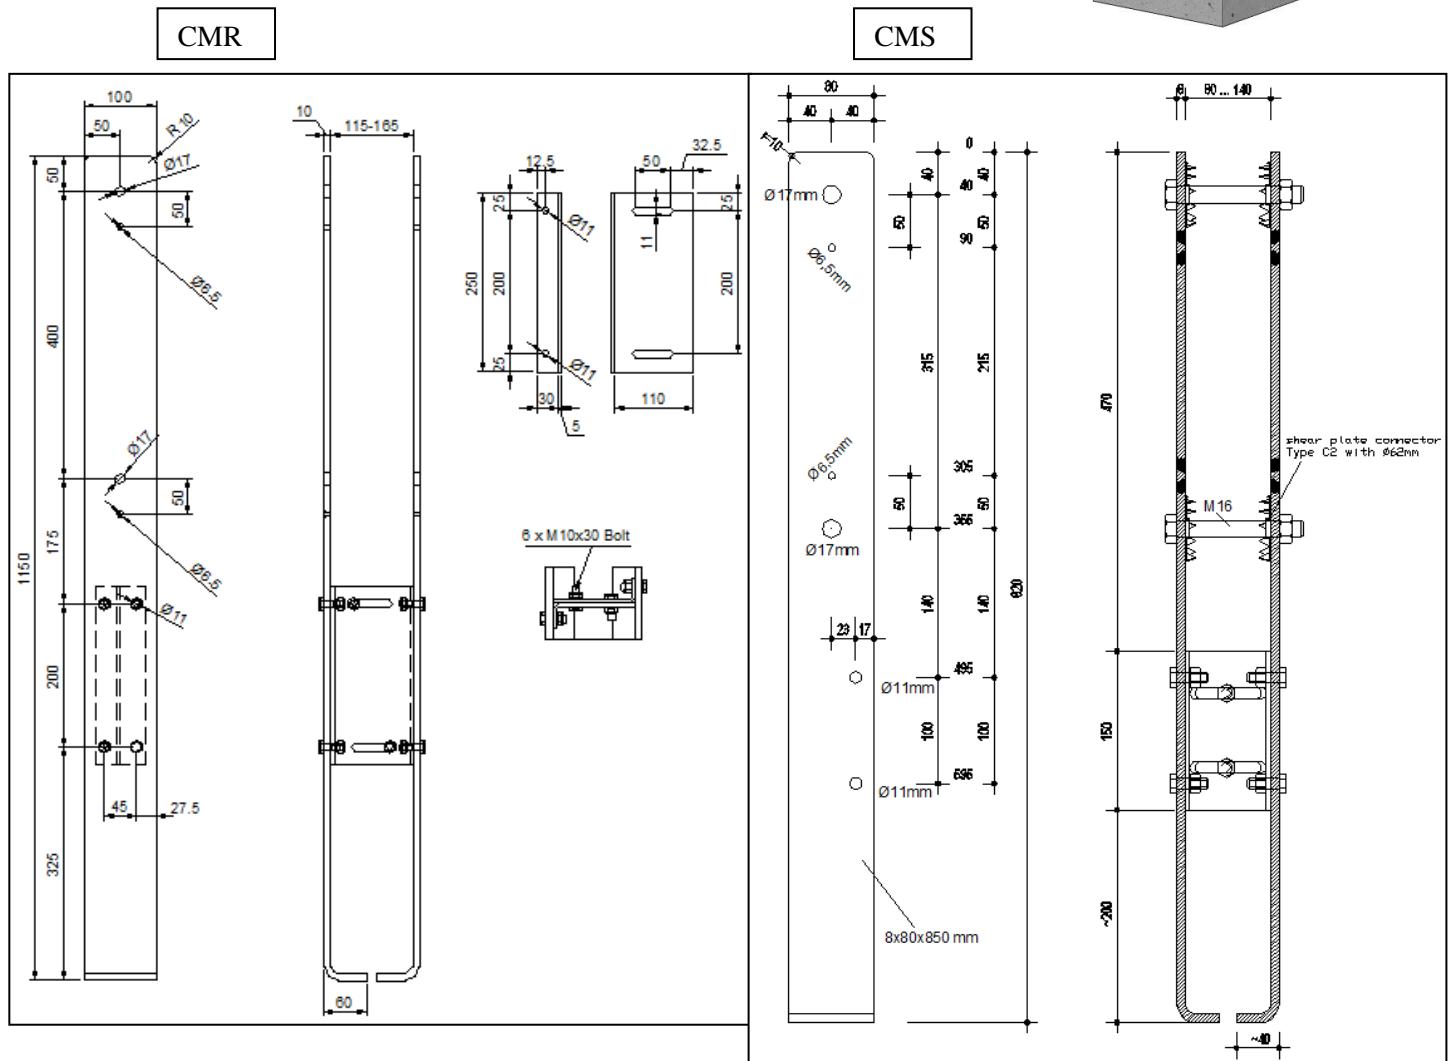

<sup>1)</sup> for steel  $k_{mod} = 1,0$  shall be used for all load durations

## D32: CMR and CMS

Product Name	alternative names			
	UK	France	DK	D
CMR				
CMS				

**Figure D32-1: Drawings**

**Table D32-1: Size specification**

n/a

**Table D32-2: Material specification**

Material thickness	Material Grades	Coating specification
6, 8, 10	S235JR according to EN 10025:2004	Hot-dip galvanized according to EN ISO 1461:1999
	Or stainless steel as described	

**Table D32-3: Characteristic capacity – for concrete C12**

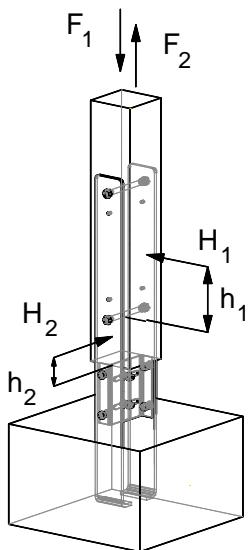

$k_{\text{modi}}=1,18$

Force direction	Timber size b [mm]	Characteristic Capacity $R_{i,k}$ [kN] bzw. [kNm]	
		min. of timber	Steel <sup>1)</sup>
$F_1 = F_2$	$\geq 115$	117,2	
$H_1$ for $h_1=200\text{mm}$	$\geq 115$	99,0	21,3
$H_2$ for $h_2=0\text{mm}$	$\geq 115$	33,0	30,9
$M_1$	$\geq 115$	19,8	13,9
$M_2$	115	6,7	
	120	7,0	
	125	7,3	
	140	8,2	
	150	8,8	
	160	9,4	

<sup>1)</sup> for steel  $k_{\text{mod}}=1,0$  shall be used for all load durations

Force direction	Timber size b [mm]	Characteristic Capacity $R_{i,k}$ [kN] bzw. [kNm]	
		min. of timber	Steel <sup>1)</sup>
$F_1 = F_2$	$\geq 80$	96,9	
$H_1$	$\geq 80$	74,0	15,0
$H_2$	$\geq 80$	21,1	19,8
$M_1$	$\geq 80$	11,6	7,1
$M_2$	80	3,9	
	100	4,8	
	120	5,8	
	140	6,8	

<sup>1)</sup> for steel  $k_{\text{mod}}=1,0$  shall be used for all load durations

For a load  $H_1$  acting in the height for CMR  $h_1 > 200$  mm (for CMS  $h_1 > 157$  mm) the load carrying capacity should not be taken as higher than:

$$\text{For CMR: } H_{R1}(h) = H_{R1}(200) \cdot 200 / h_1. \quad \text{for CMS: } H_{R1}(h) = H_{R1}(157) \cdot 157 / h_1.$$

For a load  $H_2$  acting in the height  $h_2 > 0$  mm, the load carrying capacity should not be taken as higher than:

$$H_{R2}(h) = \frac{1}{2} F_{R2} a / h_2.$$

where:

a      The inner distance between the vertical steel plates e.g. the column depth.

For a vertical load  $F$  (either  $F_1$  or  $F_2$ ) and a horizontal load  $H_1$  acting simultaneously it should be verified that  $(F/F_{R1})^2 + (H_1/H_{R1})^2 \leq 1$

For a vertical load  $F$  (either  $F_1$  or  $F_2$ ) and a horizontal load  $H_2$  in the height  $h$  acting simultaneously it should be verified that  $H_{R2}(h) \leq M_{R2} / (h (1 - F/F_{R1}))$

For combined loads the following check shall be made:

$$\left( \frac{F_{1/2,d}}{R_{1/2,d}} \right)^2 + \left( \frac{H_{1,d}}{R_{H1,d}} + \frac{M_{1,d}}{R_{M1,d}} \right)^2 \leq 1$$

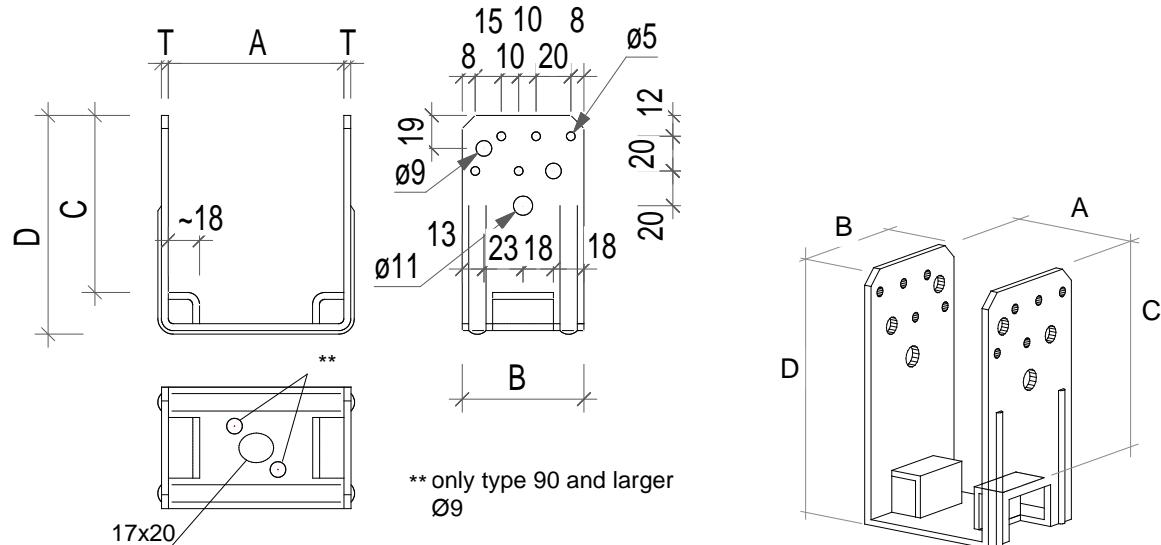

$$\left( \frac{F_{1/2,d}}{R_{1/2,d}} + \frac{M_{2,d}}{R_{M2,d}} \right)^2 + \left( \frac{H_{2,d}}{R_{H2,d}} \right)^2 \leq 1$$

### D33: PU / EMBU

Product Name	alternative names

\*\* only type 90 and larger have Ø9 holes in the bottom plate.

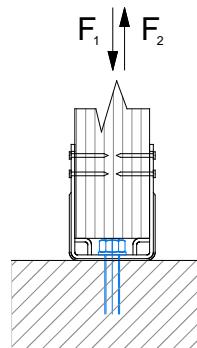

**Table D33-2: Material specification**

Material thickness	Material Grades	Coating specification
4	S235JR according to EN 10025:2008	Hot dip galvanized according to EN1461:2009
	Or stainless steel as described	

**Table D33-3: Characteristic capacity**

load direction	type	PU characteristic capacity [kN] min. of	
$F_1$	all	$\max \left\{ 19,1, n \times R_{lat,k} \right\}$	
$F_2$	PU70-B	$n \times R_{lat,k}$	14,12/k <sub>mod</sub>
	PU80-B		11,73/k <sub>mod</sub>
	PU90-B		10,03/k <sub>mod</sub>
	PU100-B		8,76/k <sub>mod</sub>
	PU120-B		6,99/k <sub>mod</sub>
	PU140-B		5,82/k <sub>mod</sub>

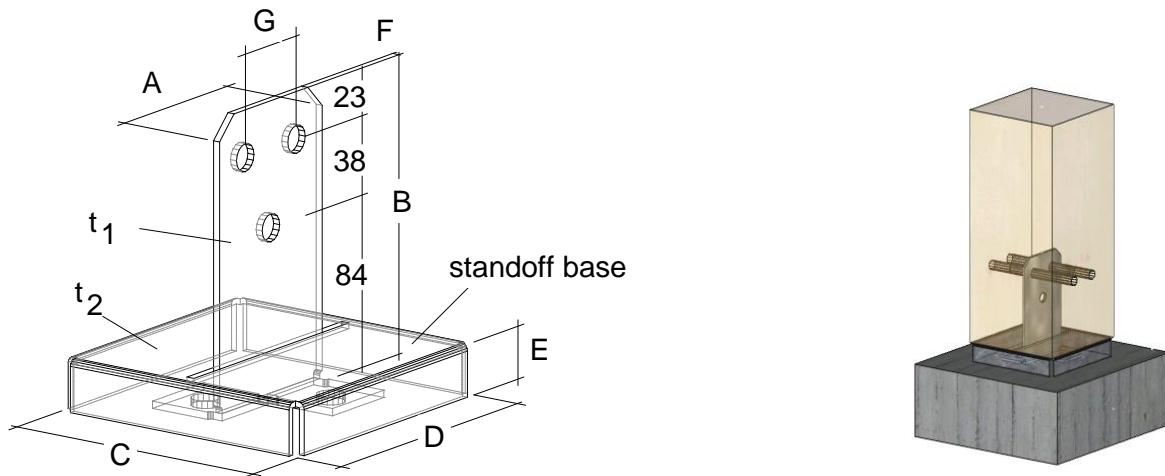

$n$  = total number of nails. If the number of nails on each side is different,  $n$  is twice the number of nails in the side where the number is the minimum

## D34: CPT

Product Name	alternative names			
	UK	France	DK	D
CPT44Z				
CPT66Z				
CPT88Z				

**Figure D34-1: Drawings**

**Table D34-1: Size specification**

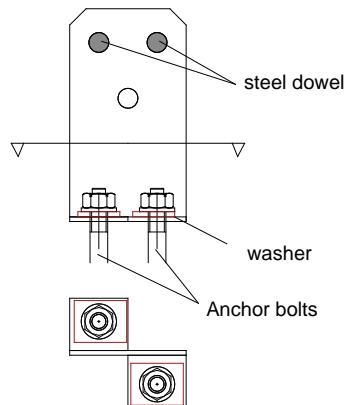

Type	Dimensions [mm]									
	A	B	C	D	E	F	G	holes □	t <sub>1</sub>	t <sub>2</sub>
CPT44Z	79,4	145	88,9	88,9	25,4	3,5	39,7	13,5	3,5	2,7
CPT66Z	114	145	136,5	136,5	25,4	3,5	57,1	13,5	3,5	2,7
CPT88Z	114	145	184	184	25,4	3,5	57,1	13,5	3,5	2,7

to use with the washer CPTZ-03, 35,7x28,6x3,5 with Ø13,5mm

**Table D34-2: Material specification**

Material thickness	Material Grades	Coating specification
3,5mm Standoff base: 2,7mm	steel SS Grade 33 according to ASTM A653	G185 according to ASTM A653  Corresponding to ~40µm

**Figure D34-2: Steel dowel pattern**

**Table D34-3: Characteristic capacity**

Characteristic capacities  $R_{i,k}$ [kN]

Types	Characteristic capacities [kN] :				steel dowels to use	
	$R_{1,k}$	$R_{2,k}$	$R_{H1,k}$	$R_{H2,k}$		
	download	uplift	lateral	lateral	No.	size [mm]
CPT44Z	$49.7/k_{mod}^{0.5}$	$10.1 / k_{mod}$	7.3	$\min(4.9, 3.5/k_{mod})$	2	$\varnothing 13 \times 70$
CPT66Z	$76.3 / k_{mod}^{0.5}$	$14.7/k_{mod}$	$\min(R_{2,k} \times 0.7, 9.1)$	$\min(6.9, 5.0/k_{mod})$	2	$\varnothing 13 \times 121$
CPT88Z	$103.0 / k_{mod}^{0.5}$	$14.7/k_{mod}$	$\min(R_{2,k} \times 0.7, 9.1)$	$\min(6.9, 5.0/k_{mod})$	2	$\varnothing 13 \times 121$

The design load has to be calculate always as:

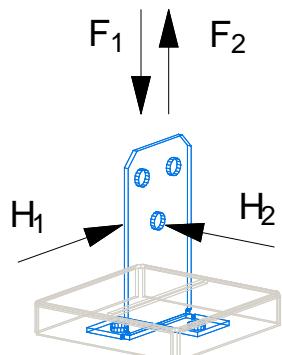

$$R_{i,d} = R_{i,k} \times k_{mod} / \gamma_M$$

For combined forces have to be checked:

$$\square (F_{i,d} / R_{i,d}) \leq 1$$

For  $F_{i,d}$  is to insert also  $H_{i,d}$ .

The timbersize have to be minimum the size of the standoff base.

**The anchorage has to be checked as following:**

For force direction  $F_2$  : the anchorage of each of the both anchors has to be a capacity of minimum  $0.88 \times F_{2,d}$

For force direction  $H_1$  : the anchorage of each of the both anchors has to be a capacity of minimum  $1.76 \times H_{1,d}$

For force direction  $H_2$  type CPT44 :

the anchorage of each of the both anchors has to be a capacity of minimum  $2.0 \times H_{2,d}$

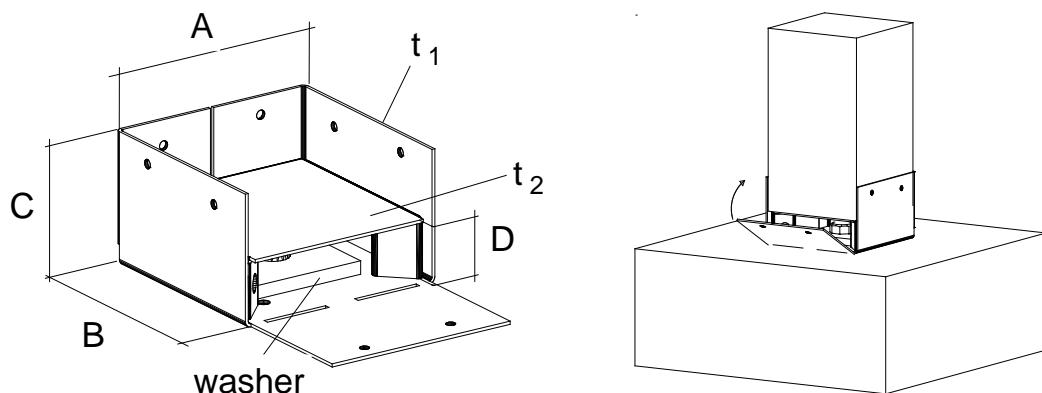

For force direction  $H_2$  type CPT66 and 88 :

the anchorage of each of the both anchors has to be a capacity of minimum  $1.1 \times H_{2,d}$

HTT5	4	26
HTT16	4	18
HTT22	4	32

**Table D60-3: Characteristic capacity**

**HTT4/5/16/22**

The characteristic load-carrying capacity of one Hold Down HTT4/5/16/22 is calculated as:

$$R_{1,k} = \min \begin{cases} (n - 3,5) \times R_{lat,k} \\ 25,2 \times R_{ax,k} \\ \frac{43,0}{k_{mod}} \end{cases}$$

R <sub>lat,k</sub> =	characteristic lateral load-carrying capacity of one nail
R <sub>ax,k</sub> =	characteristic withdrawal capacity of one nail
k <sub>mod</sub> =	load duration factor
n =	number of nails

It must be checked, that the anchor fulfils the following formula:

$$\frac{F_{1,d}}{R_{anchor,d}} \leq 1$$

The values are also applicable for a connection with a gap between the short flange of the HTT and the bearing support.

**LTT20B**

The characteristic load-carrying capacity of one Hold Down LTT 20B is calculated as:

$$R_{1,k} = \min \begin{cases} n \times R_{lat,k} \\ 2,85kN/k_{mod} \end{cases}$$

R <sub>lat,k</sub> =	characteristic lateral load-carrying capacity of one nail
k <sub>mod</sub> =	load duration factor
n =	number of nails
R <sub>anchor,d</sub> =	Tensile design capacity of the anchor bolt in the concrete

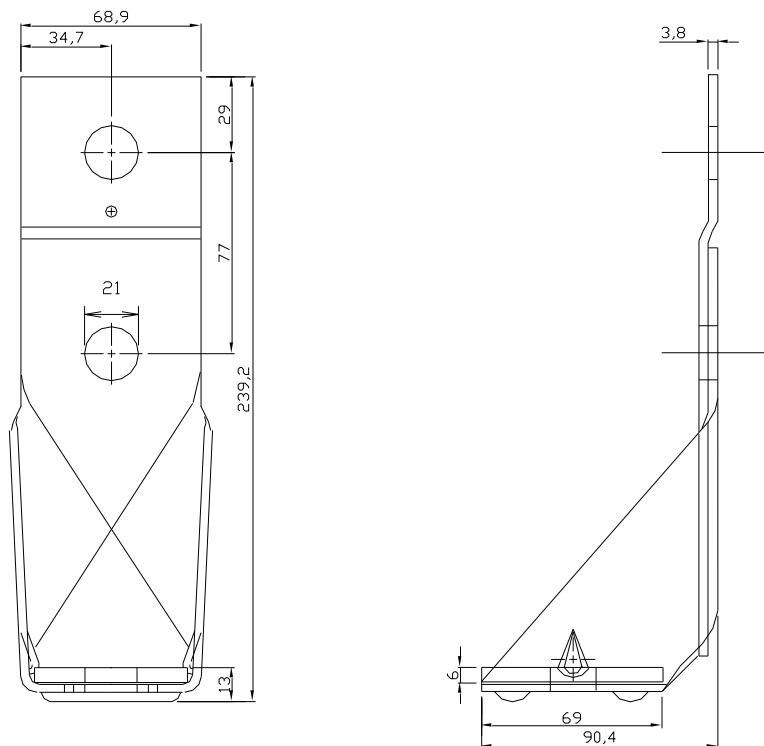

It must be checked, that the anchor fulfils the following formula:

$$\frac{1,5 \times F_{1,d}}{R_{anchor,d}} \leq 1$$

## D61: HD5A

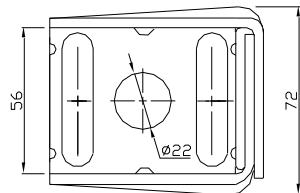

Product Name	alternative names			
	UK	France	DK	D
HD5A				

**Figure D61-1: Drawings**

**Table D60-1: Size specification**

n/a

**Table D61-2: Material specification**

Material thickness	Material Grades	Coating specification
2,7 ; 2,84	G90 galvanized steel SS Grade 33 according to ASTM A-653  corresponding to S235 JR according to EN 10025	
	Or stainless steel as described	

**Table D61-3: Characteristic capacity**

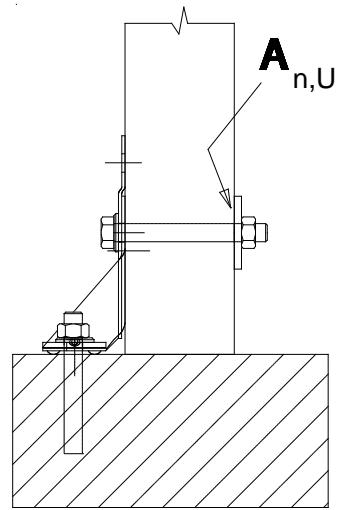

The characteristic load-carrying capacity of one Hold Down HD5A is calculated as:

$$R_{1,k} = \min \begin{cases} 8,2kN/k_{\text{mod}} \\ 4,15 \times A_{n,U} \times f_{c,90,k} \end{cases}$$

$A_{n,u} =$  net area of the washer (on the backside of connected timber)  
 $f_{c,90,k} =$  characteristic compressive strength perpendicular to timber  
 $R_{\text{anchor},d} =$  Tensile design capacity of the anchor bolt in the concrete  
 $k_{\text{mod}} =$  load duration factor

It must be checked, that the anchor fulfils the following formula:

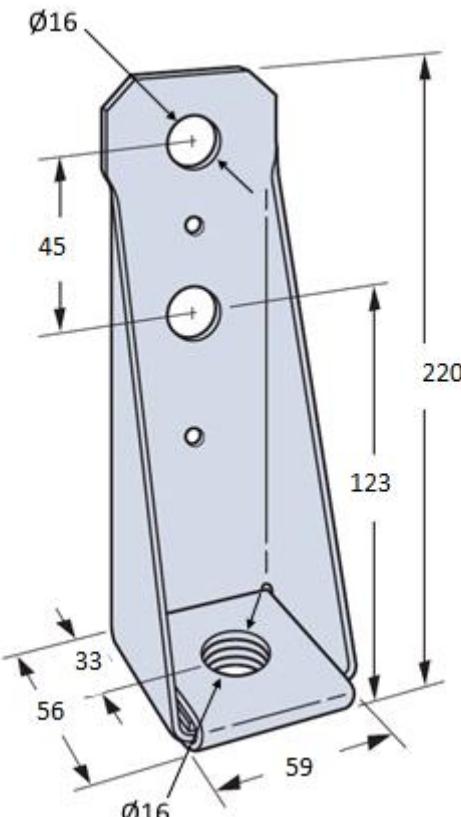

$$\frac{F_{1,d}}{R_{\text{anchor},d}} \leq 1$$

## D62: HD3B

Product Name	alternative names			
	UK	France	DK	D
HD3B				

**Figure D61-1: Drawings**

**Table D62-1: Size specification**

See drawing

**Table D61-2: Material specification**

Material thickness	Material Grades	Coating specification
2,7 ; 2,84	G90 galvanized steel SS Grade 33 according to ASTM A-653  corresponding to S235 JR according to EN 10025	
	Or stainless steel as described	

**Table D61-3: Characteristic capacity**

Model	Post	Number and Ø post	Ø on header	Characteristic values (kN) uplift
HD3B	Steel	2 Ø16	Ø16	39.89
	Timber	2 Ø16	Ø16	15.59

For a timber with a size < 100x100mm: the capacity of the bolts in the timber are to be checked:

$n \times F_{v,RK}$ ; with  $n$ = number of bolts

It must be checked, that the anchor fulfills the following formula:

$$\frac{F_{1,d}}{R_{anchord}} \leq 1$$

## D63: AKR

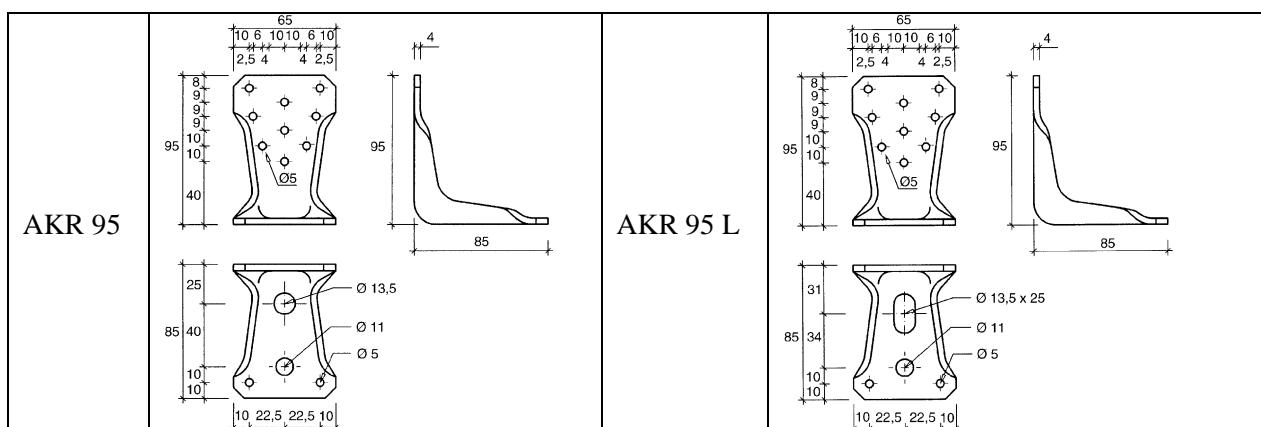

Product Name	alternative names			
	UK	France	DK	D
AKR...				

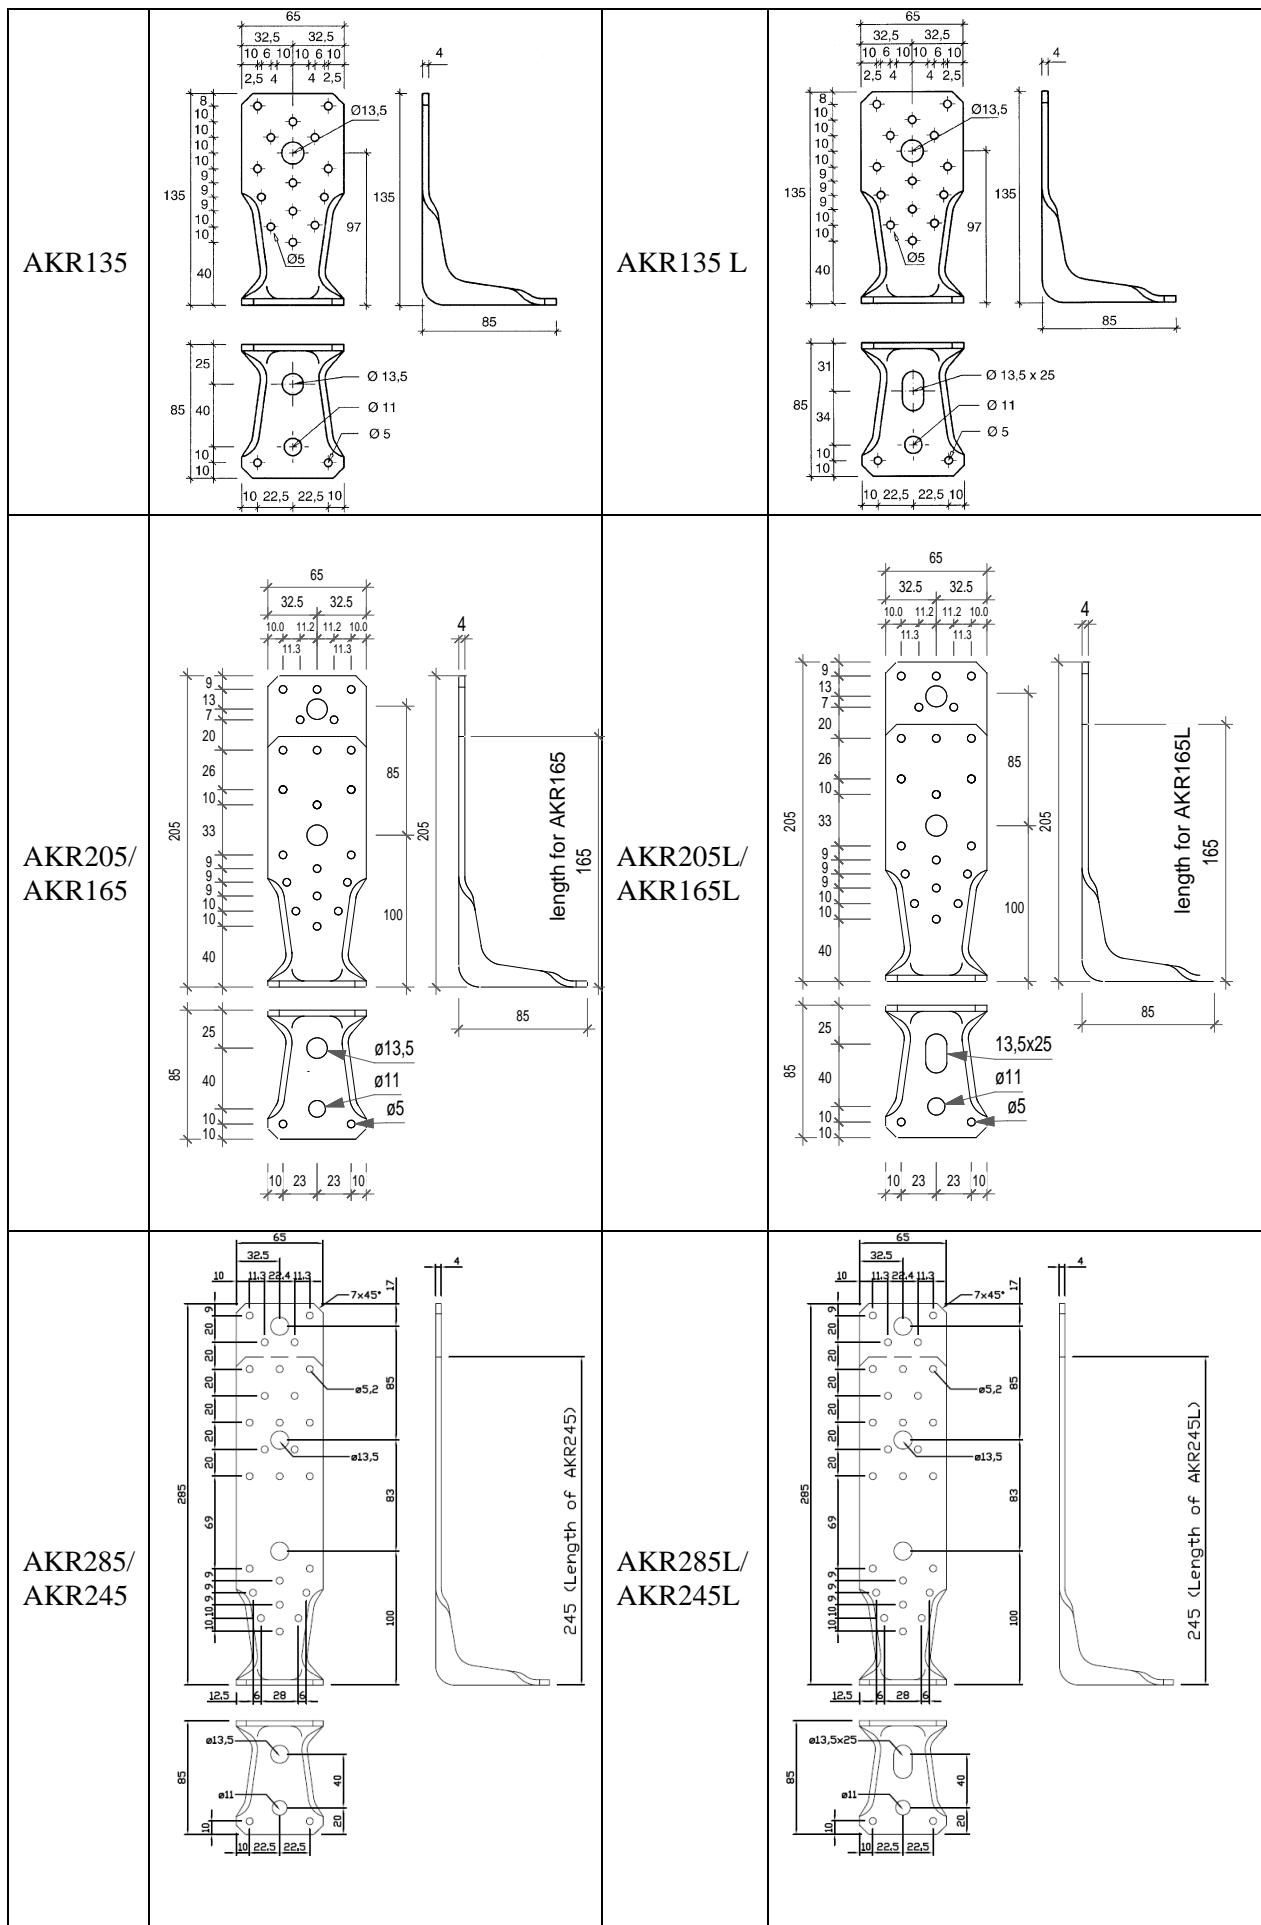

.... with following numbers and letters as shown in the table below

The letter "L" in the name shows, that a **long hole** is in the short flange.

**Figure D63-1: Drawings**

The thickness may also be 3,0 mm. See material specification.

**Table D63-1: Size specification**

n/a

**Table D63-2: Material specification**

Material thickness	Material Grades	Coating specification
4	S235JR according to EN 10025:2004	Hot-dip galvanized according to EN ISO 1461:1999
3	S250 GD according to EN 10326:2004	Pre-galvanized steel min Z275 according to EN10326:2004
3	Or stainless steel as described	

The types 165 and 245 are respectively options of the AKR205 and 285 and can only be cut at the factory (with chamfer). The corresponding nail pattern are given respectively in no 11 and no 20.

A nail pattern of a small AKR can be used for a larger AKR also, with using the capacity for the nail pattern of the smaller one.

The nail patterns 15 and 16 are only for force direction F<sub>1</sub>.

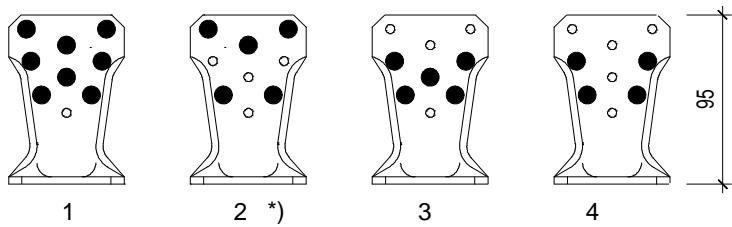

The nail pattern “partial/column” are for connection to beam and also for column.

The nail pattern “column” are also possible for a connection to a beam.

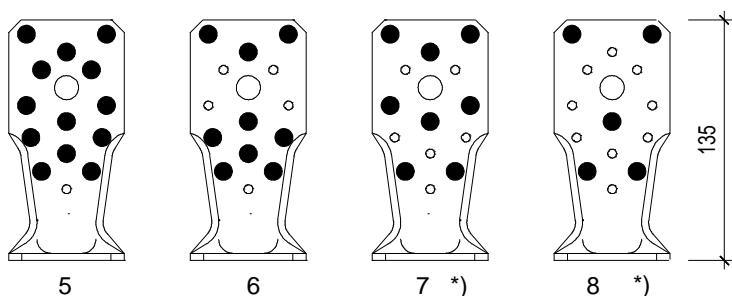

For connection to a column, nail pattern with nails in the lower part as shown below or with less nails are only to be considered :

**Figure D63-2: Nail pattern**

$n$  = number of nails according to the nail pattern

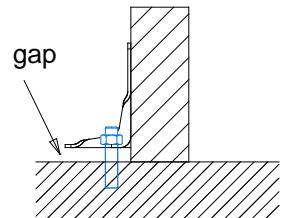

$$\text{For an AKR with a thickness of 4,0mm: } R_{1,k} = \min \left\{ \frac{R_{1,nail,k}}{\frac{21,43kN}{k_{mod}}} + R_{bend,nail,k} \right\}$$

$$\text{For an AKR with a thickness of 3,0mm: } R_{1,k} = \min \left\{ \frac{R_{1,nail,k}}{\frac{12,52kN}{k_{mod}}} + R_{bend,nail,k} \right\} \quad \text{with } R_{1,nail,k} \text{ and } R_{bend,nail,k} \text{ are given in the table}$$

before.

The force shall act in the middle of the beam/column, or the eccentricity may be overcome by clamping or an extra calculated force  $F_4$  shall be considered.

The values are also applicable for a connection with a gap between the short flange of the AKR and the bearing, for  $F_1$  load direction only.

The bolt shall have a capacity to sustain an axial force of  $F_{1,d}$ .

Instead of bolts also timber screws with washers can be applied to the bottom leg for a pure uplift force connection.

**Table D63-4: Load direction  $F_1$  for nail pattern 13 an 18:**

nails	characteristic capacity limit by the nails: $R_{1,nail,k}$ [kN] ; $n=3$ nails					
	type AKR $h=$			type AKR...L		
	73	113	153	73	113	153

n = number of nails according to the nail pattern

The connected beam shall be free of twisting, so that no rotation occurs.

For a connection to a column with this load direction, it is recommended to use 2 pieces of AKR.

The bolt shall have a min. capacity  $R_d$  to sustain an axial force of  $F_{2,d} \times 0,2$  and a lateral force of  $F_{2,d} / n_{AKR}$ . with  $n_{AKR}$  = number of AKR

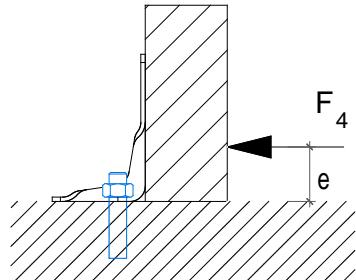

#### Load direction F<sub>4</sub> (only for types without long hole)

for AKR with a thickness of 4,0mm:

$$R_{4,k} = \min \left\{ \frac{\frac{10,6kN \times 50mm}{e \times k_{mod}}}{\frac{51kNm}{(e - 71mm) \times k_{mod}}} \right\}$$

for AKR with a thickness of 3,0mm:

$$R_{4,k} = \min \left\{ \frac{\frac{6,3kN \times 50mm}{e \times k_{mod}}}{\frac{28,7kNm}{(e - 71mm) \times k_{mod}}} \right\}$$

Negative values may not be considered, e shall be inserted in [mm]

The bolt shall have a capacity to sustain an axial force of  $F_{4,d} \times 1,5$ , and a lateral force of  $F_{4,d} \times 1,0$ .

**Table D63-6: Load direction F<sub>5</sub> (only for types without long hole)**

AKR285/AKR245	20	9	274		271	

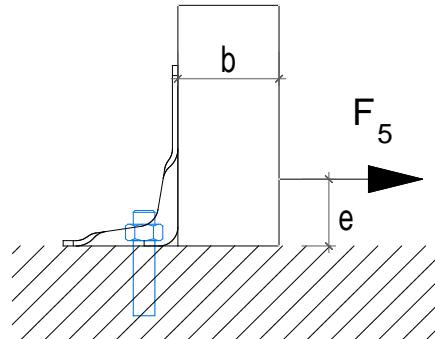

n = number of nails according to the nail pattern

$$R_{5,k} = \min \left\{ \frac{X_1 \times R_{ax,k}}{e_{max, force}}, \frac{536 kNm}{e \times k_{mod}}, \frac{51 kNm}{(e - 71mm) \times k_{mod}} \right\}$$

with R<sub>ax,k</sub> [kN] = the axial characteristic capacity of the used nail sizes "e" shall be inserted in [mm]

Negative values may not be considered.

The bolt shall have a min. capacity R<sub>d</sub> to sustain an axial force of F<sub>5,d</sub> x 1,0 and a lateral force of F<sub>5,d</sub> x 1,0.

**Table D63-7: Load direction F<sub>4/5</sub> (only for types without long hole)**

Type	nail pattern	Characteristic capacity R <sub>4/5,k</sub> [kN]
all with a thickness of 4,0mm	all	26,5/k <sub>mod</sub>
all with a thickness of 3,0mm	all	15,75/k <sub>mod</sub>

The size b shall be a minimum of 60mm.

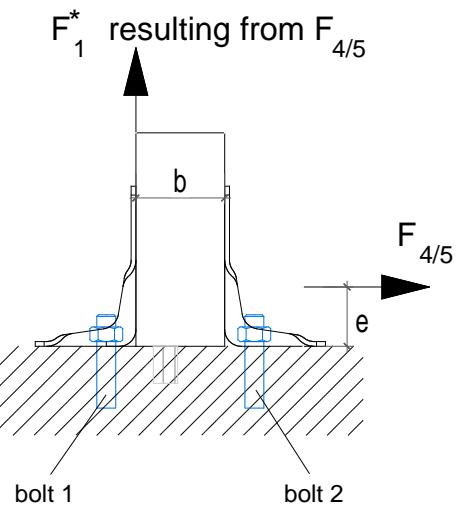

The “left” AKR shall be checked additionally for a tension force:

$$F_{1,d}^* = \frac{F_{4/5,d} \times (e - 16,5\text{mm})}{b + 83\text{mm}}$$

Sizes “e” and “b” shall be insert in [mm]

The bolt 1 shall have a capacity to sustain an axial force of F<sub>1,d</sub>\* x 1,0.

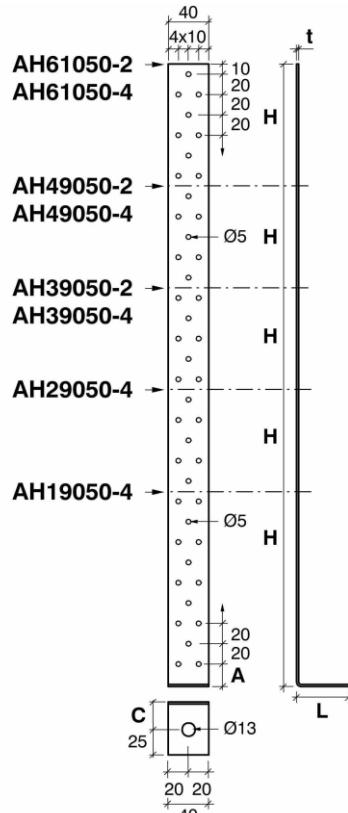

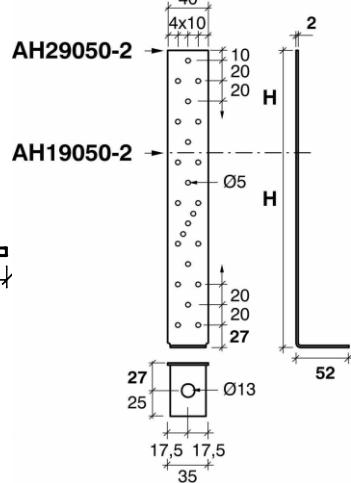

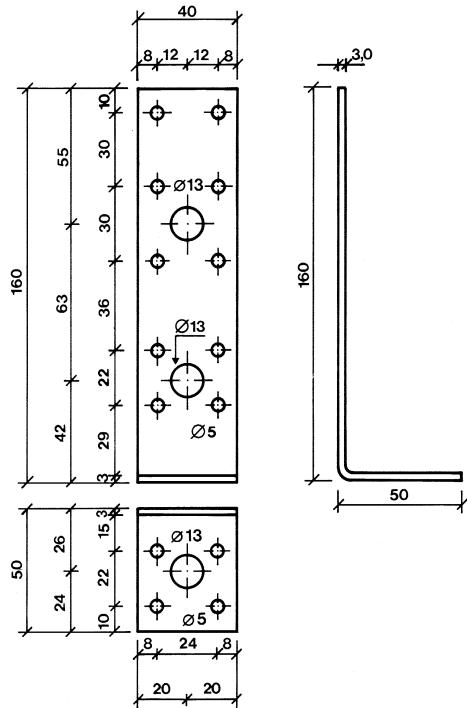

The bolt 2 shall have a capacity to sustain an axial force of F<sub>4/5,d</sub> x 0,5 , and a lateral force of F<sub>4/5,d</sub> x 1,0.

HD140M12	140	90	60	2,0	12	25	14	50	90

\* D refers to the hole diameter in the washer. Intermediate values are possible. The hole in the sheet-metal part below the washer can be up to +2 mm larger than the hole in the washer

Other lengths (H) and other width (B) are possible, for the same cross section the same capacity is given.

**Table D65-2: Material specification**

Material thickness	Material Grades	Coating specification
2 ; 3	S250 GD according to EN 10346	Pre-galvanized steel min Z275 according to EN10346
Washer 15; 20	S235JR according to EN 10025:2004	Hot-dip galvanized according to EN ISO 1461:1999
	Or stainless steel as described	

**Figure D64-2: Nail pattern**

	Minimum	Maximum
All types	2	All holes can be used by considering the minimum distance of the nails to the end of timber

**Table D65-3: Characteristic capacity**

The characteristic load-carrying capacity in N of one Tension Tie is calculated as:

$$R_{1,k} = \min \left\{ \begin{array}{l} \frac{W_{pl} \times 277}{A \times k_{mod}} \\ A_{gross} \times 223 / k_{mod} \\ n_{ef} \times R_{lat,k} \end{array} \right\}$$

$A_{gross} =$  gross cross sectional area of the vertical flap in  $\text{mm}^2 = B t_1$ , see table below  
 $R_{la,k} =$  characteristic lateral Load-carrying capacity of one connector nail  
 $n_{ef} = n^k_{ef}$  effective number of nails with  $k_{ef}$  by EC 5 , table 8.1  
 $k_r =$  reduction factor, see table below  
 $k_{mod} =$  load-duration factor  
 $W_{pl} =$  the plastic section modulus of the lower part; see table below  
 $A =$  distance of the bolt hole to the vertical flange – as given in table D65-1

typ	A gross		$W_{pl}$ [mm <sup>3</sup> ]
	[mm <sup>2</sup> ]	$k_r$	
HD340M12	80	0.84	2025
HD400M16	120	0.76	2363
HD420M16	120	0.82	4200
HD420M20	120	0.56	3800
HD480M20	150	0.68	4800
HD140M12	120	0.71	1296

It must be checked, that the anchor fulfils the following formula:

$$\frac{F_{1,d}}{R_{anchor,d} \times k_r} \leq 1$$

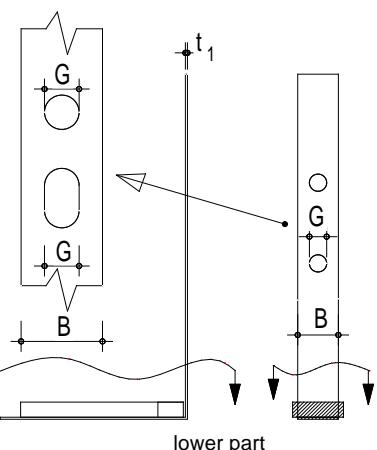

**A connection to the timber can also be occurring as shown next:**

Larger holes are possible for bolts or other fastener instead of a nail pattern.

For this cases the value  $R_{1,k}$  shall be calculate as:

$$R_{1,k} = A_{net} \times 295 \text{ N/mm}^2 \quad \text{with} \quad A_{net} = (B - G) \times t_1$$

For  $R_{lat,k}$  shall be use the characteristic lateral load-carrying capacity of the used fastener.

The lower part shall be as described before by using the  $W_{pl}$  from the table before.

#### Installation on a timber floor:

For the pressure area it may be possible to use screws for the pressure. In this case the calculation for the screws may be done separately according to the following system : see after table D66-3 (HD2P)

Table 5 Model	$R_{1,k}$ [kN]	$R_{s,k}$ [kN]	factor $k_r$	max $n_s$
HDBU163G with <sup>1)</sup>		13,7	1,55	2
HDBU220G with <sup>1) 2)</sup>		34,6	1,40	3
HDBU379G with <sup>1) 2)</sup>	$\min \left\{ R_{s,k} / k_{mod}, V_{R,k} \times n_{sc} / k_{mod} \right\}$	16,7	1,46	2
HDBW60G		19,8	2,00	2
HDBW160G		21,2	1,24	2
HDBW200G		23,4	1,23	3

It is imperativ:

$$R_{1,d} = \frac{R_{1,k} \times k_{mod}}{\gamma} \quad \text{with } \gamma \text{ for timber.}$$

It shall be to check:

$$R_{bolt,d} \geq F_{1,d} \times k_r$$

With:

$n_{ef}$  =  $n^{kef}$  effective number of nails with  $k_{ef}$  by EC 5 , table 8.1

$n_{per-side}$  = number of nails on each side

$V_{R,k}$  = characteristic Capacity of self-tapping screws (for EJOT JT2-3-5,5\*25  $V_{R,k}= 6,4$  kN)

$n_{sc}$  = number of self-tapping screws

$R_{ax,k}$  = characteristic axial capacity of one nail in kN

$R_{bolt,k}$  = characteristic withdrawal capacity of the (anchor)-bolt in kN

$R_{lat,k}$  = characteristic lateral load-carrying capacity of one nail in kN

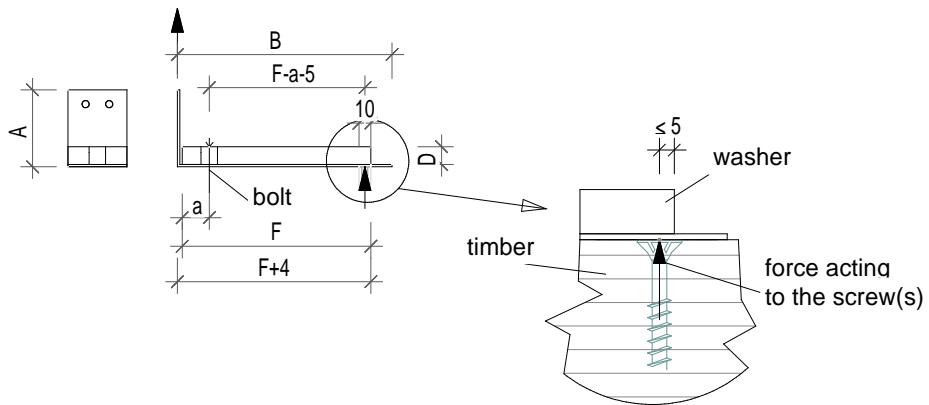

$k_r$  = factor to calculate the force in the bolt

$R_{s,k}$  = capacity given in the table

The capacity of a combination of an upper and lower part is given by the lower capacity of both parts.

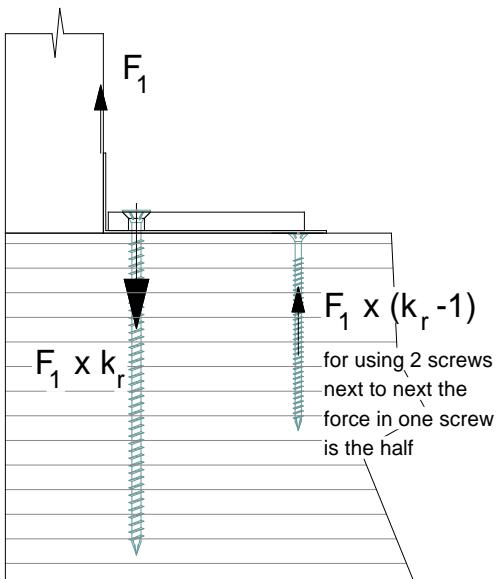

#### Installation on a timber floor:

For the pressure area it may be possible to use screws for the pressure. In this case the calculation for the screws may be done separately according the following system:

The force for the screws at the end of the washer may be calculated with the given lever arms.  
The screws may be placed with a distance of 5 mm from the end of the washer.

The force axial to the screw is:  $F_{ax,d} = F_{1,d} \times (k_r - 1)$  as compression

The distances between the screws and to the edges are to be considered, as given in an approval or according EN1995 or a national standard.

#### A connection to the timber can also be occurring with a HDUFxx next

Larger holes are possible for bolts or other fasteners instead of a nail.

For this cases the value  $R_{1,k}$  shall be calculate as:

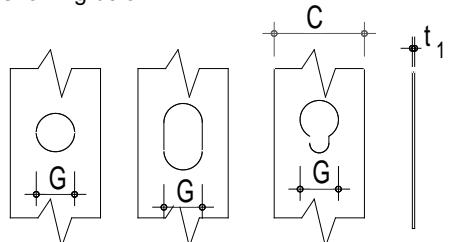

$$R_{1,k} = \min \left\{ \frac{n_{ef} \times R_{lat,k}}{A_{net} \times 295 \text{ N/mm}^2}, \frac{k_{mod}}{k_{mod}} \right\}$$

With  $A_{net} = (C-G) \times t_1$

$R_{lat,k}$  is the characteristic lateral load-carrying capacity of the used fastener.

The length of the HDUF may be selected as required for the used fastener.

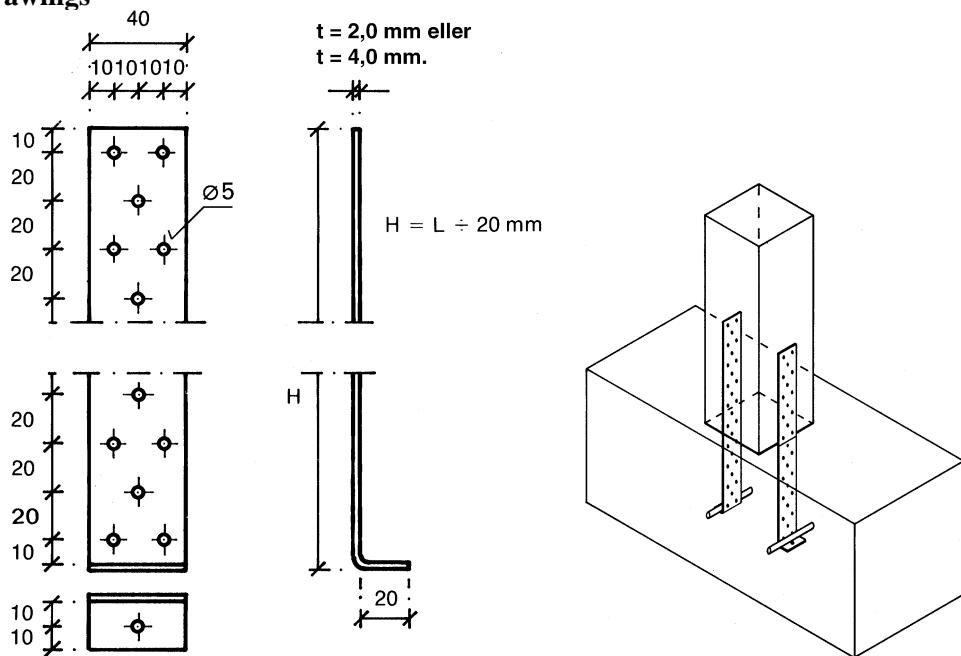

HDUF: the hole pattern may be modified as showing below:

## D69: PROFA

Product Name	alternative names			
	UK	France	DK	D
PROFA				

Figure D69-1: Drawings

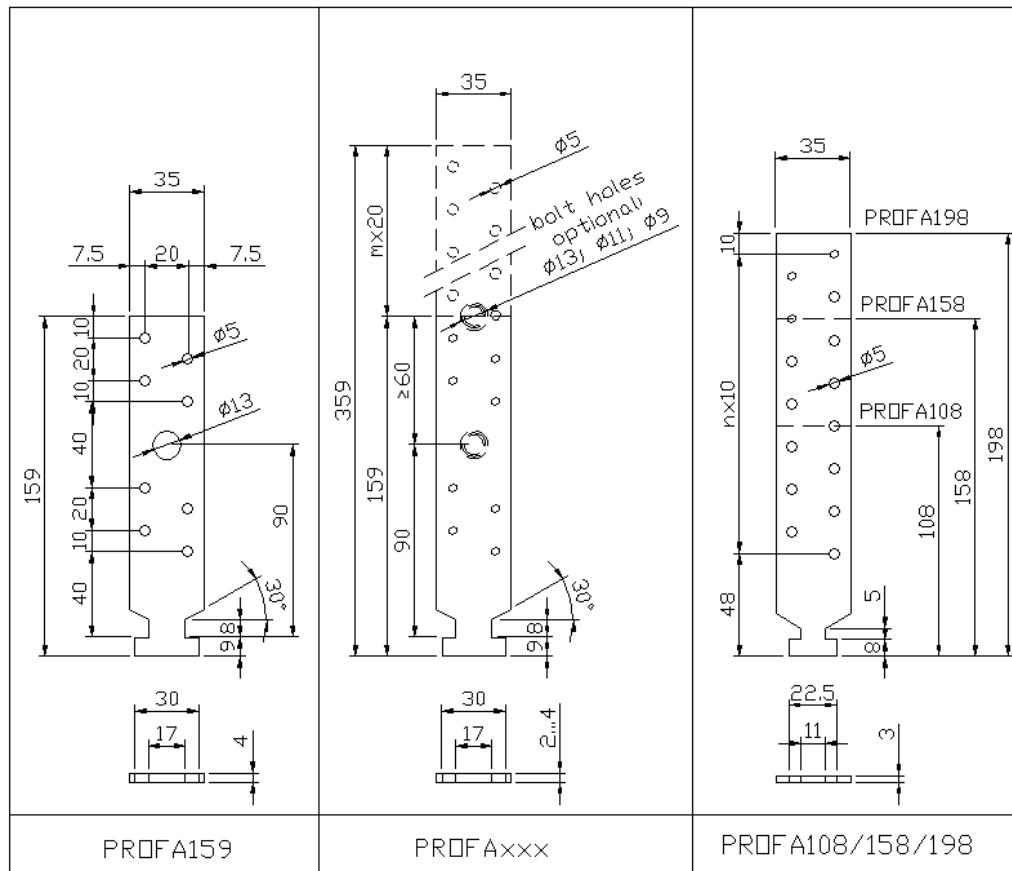

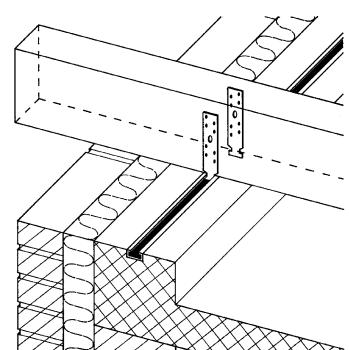

Table D69-1: Size specification

n/a

Table D69-2: Material specification

Material thickness	Material Grades	Coating specification
2 ; 4	S250 GD according to EN 10346	Pre-galvanized steel min Z275 according to EN10346
	Or stainless steel as described	

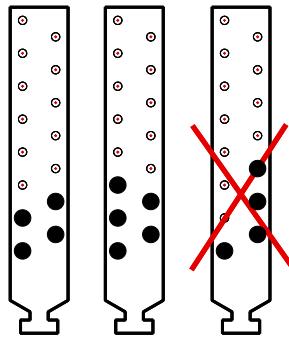

Nail pattern:

	Minimum	Maximum
PROFA108	2	6
PROFA158	2	10
PROFA198	2	14
PROFA159	2	8
PROFA XXX	2	28

The size for type PROFA xxx may be in a range from 159 mm to 359 mm in steps of 20mm

The nails shall be placed alternating in height.

**Table D69-3: Characteristic capacity**

The characteristic load-carrying capacity of one Profile Anchor is calculated as:

For PROFA 108/158/198 (thickness = 3,0 mm)

$$R_{1,k} = \min \begin{cases} n \times R_{lat,k} \\ 6,3kN / k_{mod} \end{cases}$$

For PROFA 159 to PROFA 359 (thickness = 4,0mm)

$$R_{1,k} = \min \begin{cases} n \times R_{lat,k} \\ 9,4kN / k_{mod} \end{cases}$$

For PROFA 159 to PROFA 359 (thickness = 3,0mm)

$$R_{1,k} = \min \begin{cases} n \times R_{lat,k} \\ 7,1kN / k_{mod} \end{cases}$$

For PROFA 159 to PROFA 359 (thickness = 2,0mm in steel 1.4529)

$$R_{1,k} = \min \begin{cases} n \times R_{lat,k} \\ 5,65kN / k_{mod} \end{cases}$$

n = number of the nails / connector screws; the nails will be used side by side.

R<sub>lat,k</sub> = characteristic lateral capacity of the connector nail / bolt M12

k<sub>mod</sub> = load-duration factor
